The sequences given in AAR74763-70 represent various pentraxins and legume lectins. All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum amyloid P (SAP) binding to amyloid fibrils. The similarities in the amino acid sequences of SAP, human and Limulus C-reactive protein (CRP) and female hamster protein suggests that they may have similar 3-D structures. The jellyroll topology of the pentraxins is reminiscent of the picornavirus coat proteins which also have pentameric structures. However, pentaxins resemble more closely legume lectins such as concanavaline A and pea lectin. Alignment of sequences on the basis of topologically equivalent features of the positions in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. 11%. The two main helices in SAP occur before and after strand L, whereas the helices in the legume lectins occur at the C-terminus of strand J.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             There is a long insertion between the end of the helix after strand D and the begining of strand E in the lectins relative to pentraxins. Strands G, H and I together with the type IV beta-hairpin between H and I are identical in both SAP and pea lectin. The so-called pentraxin octapeptide signature sequence, HXXS/TWXS, is in this region so it is not conserved in the legume lectins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            --ADGIAFFISNIDSSIPSGSTGRILGL--------FPDANADI-IVAVELDT 102

The invention relates to Robinia pseudoacacia lectins which can be used in medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous cells including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytocoxic drugs and radiation. The present sequence represents a polypeptide subunit of R. pseudoacacia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          62 SMA-VSSFETNLTIQISTPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPT 120

                                                                                                                                                                                                                                                                                  The invention relates to Robinia pseudoacacia lectins which can be used proliferation. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents a R. pseudoacacia lectin RpbAI. This lectin is composed of two subunits polypeptide a and polypeptide bettin is lectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121 SENQSFGDVNTDSRVVAVEFDTFPNANIDPNYRHIGIDVNSIKSKETARWEWQNGKTATA 180

The invention relates to Robinia pseudoacacia lectins which can be used proliferation. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damaging agents, especially in the treatment of cancer, and/or for useful for the treatment of metabolic disorders. It is especially particularly human cells and/or tissues, particularly human cells and/or tissues (especially mocous membrane). Use of the lectin is effective and does not including mucous membrane). Use of the lectin is effective and does not present sequence represents a polypeptide subunit of R. pseudoacacia lectin RPbAI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δŏ
                                                                                                                                                                                                                                The invention relates to Robinia pseudoacacia lectins which can be used In medicine. The lectin is used for the control of mucosal cell proliferation, for the reduction and/or treatment of damage caused by cell damaging agents, especially in the treatment of cancer, and/or for the reduction and/or treatment of metabolic disorders. It is especially useful for the treatment of mucositis in mammalian cells and/or tissues, particularly human cells and/or tissues (especially mucous membrane). Use of the lectin is effective and does not including mucous membrane). Use of the lectin is effective and does not damage the gut as is the case with cytotoxic drugs and radiation. The present sequence represents as R. pseudoacacia lectin RPBAII. This lectin is composed of the subunit- polypeptide c (AAY06813).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121 SENQSFGDVNTDSRVVAVEFDTFPNANIDPNYRHIGIDVNSIKSKETARWEWQNGKTATA 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of pea cv. Lincoln lectin. The invention relates to: a transformed Brassica plant that is resistant to certain insect pests; an expression cassette containing DNA that codes for at least 1 lectin selected from Con A (see ANYS8736), modified Con A (see ANYS8737) and pea lectin; transgenic plant cells containing at least 1 copy of the DNA; a new lectin derived from the jack bean Con A gene, a method of imparting resistance to insects selected from blossom beetles (pollen bly)lutereta, and root files of the genus Delia; and a method for protecting a plant against infestation by insects of these genera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2 QSLSFNFTKFDLDQKDLIFQGDATSTNNVLQLTKLDSGGNPVGASVGRVLFSAPFHLWEN 61

The sequences given in AAR74763-70 represent various pentraxins and legume lectins. All these proteins show structural homology and may be used in the molecular design of a molecule for the inhibition of serum anyloid P (SAP) binding to anyloid fibrils. The similarities in the amino acid sequences of SAP, human and Limulus C-reactive protein (CRP) and female hamster protein suggests that they may have protein (CRP) and female hamster proteins suggests that they may have similar 3-D structures. The jellyroll topology of the pentraxins is reminiscent of the picornarius coat proteins which also have contameric Structures. However, pentaxins resemble more closely lequime lectins such as concanavaline A and pea lectin. Alignment of sequences on the basis of topologically equivalent features of the three dimensional structures shows that helices occupy different positions in the pentraxins and legume lectins and that the amino acid sequences of the two families have identities of only approx. 11% The two main helices in SAP occur before and after strand L, whereas the helices in the legume lectins occur at the C-terminus of strand J. There is a long insertion between the end of the helix after strand C. There is a long insertion between the end of the helix after strand C. There is a long the strand E in the lectins relative to pentraxins. Strands G, H and I together with the type IV beta-hairpin between H and I are identical in both SAP and pea lectin. The so-called pentraxin cetapeptide signature sequence, in the legume lectins, is in this region so it is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                85 ADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPTSENQSFGDVNTDSRVVAVEFDTFP 144

The invention describes compounds derived from Bauhinia purpurea lectin ((BPL), a 262 amino acid peptide comprising 7 lysine residues - the present sequence) by the replacement of one or more lysine residues with other amino acid residues which either preserve the positive charge or provide a neutral residue at the point of substitution. The compounds are useful as larvicides against insects such as the European corn borer consecul as larvicides against insects such as the European corn borer corn borer. The BPL-derivatives are effective against insects which may be resistant to the naturally occurring form of BPL. Crops which may be protected using the BPL derivatives are effective against insects which may be protected using the BPL derivatives are conn/maize (2ea mays), rye, can borer. The BPL-derivatives are conn/maize (2ea mays), rye, be protected using the BPL derivatives are conn/maize (2ea mays), rye, can lilet, rice, triticale, sunflower, alfalfa, rapesed and soybean), fiber crops (such as cotton), fruit crops (such as melons) and vegetable crops (such as onion, pepper, tomato, cucumber, squash, carrot, crucifer (e.g. cabbage, broccoll and cauliflower), eggelant, spinach, pottato and lettuce). The compounds are useful for protecting species from the genera (citus, Linum, Geranium, Manicot, Dauccus, Arabidopsis, Brassica, Citus, Atropa, Capsicum, Datura, Hyoscyamus, Lycopersicon, Nicotiana, Solanum, Petunia, Digitalis, Majorana, Cichorium, Helianthus, Catcucus, Bromus, Astropa, Atropa, Capsicum, Datura, Hyoscyamus, Lycopersico, Cactucus, Bromus, Astropa, Capsicum, Ranunculus, Senecio, Salpiglossis, Cactucumis, Browallia, Glycine, Lolium, Triticum and batura. The present crops sequence represents the B. purpurea native lectin sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         77 -STPHPYYAADGFAFFLAPHDTVIPPNSWGKFLGLYSNVFRNSPTSENQSFGDVNTDSRV 135
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Indels 18; Gaps

I'A novel mannose-specific and sugar specifically aggregatable lectin
from bark of the Japanese pagoda tree (sophora japonica).";
J. Biol. Chem. 266.3146-3153(1991).
I-FUNCTION: MANNOSE/GLUCOSE-BINDING BARK LECTIN. DISPLAYS
HEMAGGLUTINATING ACTIVITY. THIS ACTIVITY IS LOST AT PH BELOW 6.
I-FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS
STOCKS OF NITROGEN DURING DORMANT PERIOD. SELE-AGGREGATABLE
MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY
COULD ALSO PLAY A ROLE IN THE PLANY'S DEERNCE AGAINST PHYTOPHAGOUS
INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.
INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.
TRANSLATIONALLY CLEAVED INTO A TWO SMALLER POLYPEPTIDES: AI AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                207 GVEATANISYNPVSORLTAVSSYPNSEDITVHYDIDLKTVLPEWVRVGFSASTGENVEIN 266

-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANY'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIYORUS HIGHER ANIMALS (BY SIMILARITY).
-!- SUBINIT: HOMOTERRAMER OR HETEROTETRAMER OF MAHB AND MALB SUBUNITS.
                                                                                                       van Damme E.J.M., Van Leuven F., Peumans W.J.,
"Isolation, characterization and molecular cloning of the bark lectins

"A lectin and a lectin-related protein are the two most prominent proteins in the bark of yellow wood (Cladrastis lutea)."; plant Mol. Biol. 29:579-598(1995).

-!- FUNCTION: MANNOSE/GLUCOSE BINDING BARK LECTIN.

-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MISCELLANEOUS: BINDS ONE MANGANESE (OR OTHER TRANSITION METAL) ION AND ONE CALCIUM ION. MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBLYOROUS HIGHER ANIMALS.

-!- SUBUNIT: RPBAI IS COMPOSED OF TWO POLYPEPTIDES. A AND B, THAT ASSOCIATE INTO FIVE DIFFERENT TETRAMERIC ISOLECTINS. THE A4 COMBINATION IS THE ONLY ONE PAGLOTINATION ACTIVITY.

ISOSOR B4 DISPLAYS MAXIMAL AGGLUTINATION ACTIVITY.

-!- TISSUE SPECIFICITY: MOSTLY IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE INNER BARK. FEWER IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE INNER BARK. FEWER IN THE AXIAL AND SAY PARENCHYMAL CELLS OF THE INNER BARK IN AUTUMN AND WINTER AND DISAPPEARS IN MAY.

-!- SIMILARITY: TO OTHER LEGUMINOUS LECTINS.

                                                                                                                                                                                                                                                                                Rouge P., Peumans W.J.;
"The bark of Robbina pseudoacacia contains a complex mixture of lectins. Characterization of the proteins and the cDNA clones.";
Plant Physiol. 107:833-843(1995).
-!- FUNCTION: NACETLL-D-GALACTOSAMINE SPECIFIC LECTIN.
-!- FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MALGULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENSE AGGREGATABLE COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENSE AGGREGATING PHARDOUS LINNER ANIMALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: RPBAI IS COMPOSED OF TWO POLYPEPTIDES, A AND B, THAT ASSOCIATE INTO FIVE DIFFERENT TETRAMERIC ISOLECTINS. THE A4 COMBINATION THE ONLY ONE DEVOID OF AGGLUTINATION ACTIVITY.

TISSUE SPECIFICITY: STRONG EXPRESSION IN SEED. LOWER LEVELS IN THE FLOWER, AND THE BRAK OF THE ROOTS. NO EXPRESSION IN LEAF. THE SIMILATION ACCUMULATES IN THE INNER BARK IN AUTUMN.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A.Residues: 30-41:160-173 <BOW>
C.Comment: The mature chain (see PIR:CVJB) consists of residues 164-281 followed by 30-1
the signal sequence; cleavage after asparagines at positions 148, 163, and 281 is follo
C.Superfamily: plant lectin
C.Keyvords: glycoprotein
F.1-29/Domain: signal sequence #status predicted <SIG>
F.149-163/Domain: glycopeptide #status predicted <GLP>
F.148-149/Cleavage site: Asn-Val (unidentified proteinase) #status experimental
F.152-Binding site: carbobydrate (Asn) (covalent) #status experimental
F.152-Binding site: Asn-Ala (unidentified proteinase) #status experimental
F.163-164/Cleavage site: Asn-Glu (unidentified proteinase) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        R;Bowles, D.J.; Marcus, S.E.; Pappin, D.J.C.; Findlay, J.B.C.; Eliopoulos, E.; Maycox, F. agglutinin II precursor - black locust
N;Alternate names: lectin
C;Species - bobinia pseudoacacia (black locust)
C;Date: 19-Mar-1997 #sequence_revision 19-Mar-1997 #text_change 07-May-1999
C;Accession: S62691; S62686
C;Accession: S62691; S62686

A;Description: Legume seed lectin genes: sequence of Mslec2 from Alfalfa, Alfalfa and
A;Reference number: 216780
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A. Reference number: A66034; PDB:11ES
A. Contents: annotation; X-ray crystallography, 1.9 angstroms, residues 1-181;182-228
A. Contents: annotation; X-ray crystallography, 1.9 angstroms, residues 1-181;182-228
C. Complex: heterotetramer of two alpha and two beta chains
C. Superfamily: plant lectin
C. Superfamily: plant lectin
C. Reywords: calcium; glycoprotein; heterotetramer; lectin; manganese; metalloprotein
F.1-181,180-233/Product: lectin #status experimental - kmT>
F.181,22-233/Product: lectin #status experimental - kmT>
F.182,123,70omain: alpha chain #status experimental - kACH>
F.182,129,136/Binding site: manganese (Glu, Asp, Asp, His) #status experimental
F.121,123,125,129/Binding site: calcium (Asp, Phe, Asn, Asp) #status experimental
